TESTING WITH RAILS & RSPEC
guided notes

TESTING IN RAILS WITH RSPEC

The following is template for how you write an expectation in RSpec:

```
expect(actual).to matcher(expected)
```

Do the following:

1. Circle the two parts of this statement that will remain EXACTLY the same when you write an expectation & label them #1
2. Underline the three parts of the statement that are just placeholders

What is an example of a matcher method you can use in your expectations?

Check out the following line of code. What is the purpose of the `populates the @pin variable with the appropriate pin` bit?

```
it 'populates the @pin variable with the appropriate pin' do

end
```
